

Problem Set 2

Below From textbook (please note some are very challenging and are more for fun i.e. $T(n/2+2)$ that one specifically is a fun problem.)

Solving Recurrence with Substitution

- 1.) 4.3-1
- 2.) 4.3-2
- 3.) 4.3-7

Solving Recurrence with recursion tree method

- 4.) 4.4-3
- 5.) 4.4-4

Master's Theorem

- 6.) 4.5-1
- 7.) 4.5-4,
- 8.) 4-2 a & b,

Algorithms, Analysis and solving Recurrences

- 9.) (a) Show how to Merge (not Mergesort) three ordered lists each of size $n/3$, with a total of at most $\frac{5}{3}n$ compare operations.
- (b) Let's examine a new Merge sort algorithm, where parameter A in (A,n) is a list of numbers to be sorted and n is the total length of list A.

Procedure mergeSort (A,n)::

```

    if
        n=1 then return A
    Else
        divide A into three equal size lists B, C, D,
         $B := \text{mergesort}(B, n/3)$ 
         $C := \text{mergesort}(C, n/3)$ 
         $D := \text{mergesort}(D, n/3)$ 
        return merge(B, C, D)
    End.
```

Set up and solve a recurrence relation to analyze the worst-case number of operations of compares that this version does.

10.)Review 2

```

float useless(A){
    n = A.length;
    if (n==1){
        return A[0];
    }
    let A1,A2 be arrays of size n/2
    for (i=0; i <= (n/2)-1; i++){
        A1[i] = A[i];
        A2[i] = A[n/2 + i];
    }
    for (i=0; i<=(n/2)-1; i++){
        for (j=i+1; j<=(n/2)-1; j++){
            if (A1[i] == A2[j])
                A2[j] = 0;
        }
    }

    b1 = useless(A1);
    b2 = useless(A2);
    return max(b1,b2);
}

```

What is the asymptotic upper bound of the code above?
